

Renewable Energy: Bio Diesel

Today's recording comes from a radio show and podcast called [Everything Green Radio](#). (This recording is from [show number 200](#). . . they have a lot you can listen to, if you're interested in renewable energy.)

The interview we'll be listening to is with a man named Dan from a company called [Azure Biodiesel](#), a company that sells a machine to turn used vegetable oil into biodiesel, which works just like regular diesel in a car or generator or heating system.

I'm sorry, but the quality of the recording isn't great this time, and it might be difficult to understand some of the things that Dan says. Remember, you can always listen to the recording twice.

After You've Listened to the Recording

Would you be interested in a machine like the one that Dan describes in the interview? Would you be willing to do a little bit of work to get your fuel more cheaply? Or is the environmental issue more important to you?
